

Setting up Bookstack

Turned out to be pretty simple.

```
deployment.secrets.bookstack-app-key = {  
  []source = "../private/bookstack/app-key";  
  []destination = "/var/lib/bookstack/app-key";  
  []owner = { user = "bookstack"; group = "bookstack"; };  
  []permissions = "0700";  
};  
  
services.bookstack = {  
  []enable = true;  
  []hostname = "wiki.slightly.tech";  
  []maxUploadSize = "10G";  
  []appKeyFile = "/var/lib/bookstack/app-key";  
  []nginx = { enableACME = true; forceSSL = true; };  
  []database = { createLocally = true; };  
};
```

Server was running an old version of NixOS, 23.05, where MySQL doesn't work in a VPS (anymore). Upgraded the whole thing to 24.11 and then it Just Worked.

Afterwards, run:

```
bookstack bookstack:create-admin
```

... in a terminal on the server to set up the primary administrator account. Done.
